

REV-71 – ALM Invoice Code Automation

Production findings & decisions needed · 13 June 2026 · read-only analysis of LBR_PROD (nothing changed)

In one line: the automation is built, tested and ready in the sandbox. Before go-live, production data shows two of the original coding *rules* don't match how the business has actually been coding — three questions need a decision.

Headline — the engine reproduces only 170 of 319 historically coded deals (53%). The other 47% are inconsistent manual entries (the very problem this project removes) — but two patterns are too systematic to be error and reveal rules the spec got wrong.

✓ Confirmed correct — no discussion needed

- **One code per deal** — 0 of 319 deals ever carry two codes.
- **Code lands on every line** of the group, including the secondary product.
- **Standalone sellable bundles** (Law.com Pro, Mid Market) are never coded — correct.
- **Bundle child lines** are essentially never coded (2 of 874) — matches the build.

■ Decisions for Cayla

- 1. What makes a Law.com + International deal a “1” vs a “3”? **It is not price.** In all 113 such deals Law.com is the bigger line, yet 38% were coded **3**. Some other factor decides it (lead product? region? subscription type?). Until known, ~38% of these would be mis-coded.
- 2. **Code 2 (GLL) on deals with no GLL product** — 7 of 18. Is the rule broader than “GLL present”, or is this manual error?
- 3. **102 deals coded on Law.com-family add-ons** (News Vault, Radar, Compass) with no core Law.com line. Should the whole Law.com family trigger code 1, not just the one core product?

■ Knock-on effect (backfill)

Because only 53% of existing codes reproduce, the historical codes **cannot be trusted as the target** for clean-up. A read-only audit is ready to list every wrong deal; remediation needs the rules locked **and** Integra's confirmation that changing a code mid-contract is safe.

Recommendation

Don't change the engine yet — it correctly applies the consistent rules, and bending it toward messy history would be wrong. Answer questions 1–3 and it's one contained change plus a re-test. For momentum, the engine can go live for the clean majority now via its built-in on/off switches, holding only the Law.com + International subset until question 1 is settled.

Build status: 22/22 test matrix · 11/11 automated regression suite · production runbook complete · monitoring deployed. Source: scripts/rev71_backfill_audit.apex (read-only).
